

Data Dashboard and Report For Sales Data

Data Overview:

There are two sheets in the dataset:

- Sales Data: Over a two-month period (June 2022–July 2022), this data includes information such as user IDs, products purchased, payment status, coupon codes, transaction amounts, etc.
- Product Language: Assigns product codes to the corresponding language categories (English, Tamil, Hindi, and Multilingual).

Key Findings:

a)Time Period:

- From 2022-06-01 to 2022-07-31, the data spans 61 distinct sales dates.
- With 404 transactions, 2022-06-19 saw the highest transaction frequency.

b)Transaction Summary:

- 9,514 transactions in total
- 5,885 unique users

- User6679 was the most frequent user, showing up 45 times.
- Product 8 was the most purchased, showing up 1,560 times.
- 7,782 instances of the most frequent payment status, initiated, indicate that many transactions might not have finished.

c)Products:

- There were 141 distinct products sold.
- A sizable amount of sales are attributable to the top product (Product 8).
- Products are categorized by the Product Language sheet into:
- Multilingual

Hindi

English

Tamil

d)Payment Status:

- Started: 7,782
- Completed, Failed, and so forth are examples of additional statuses.
- Incomplete transactions are a serious problem.

e)Revenue Insights:

- The range of transaction amounts is ₹4.68 to ₹29,992.
- Approximately ₹1,465 is the average transaction amount.
- Given that the 75th percentile transaction amount is ₹1,999, it appears that more expensive items are not as common.
- Good data completeness for payments is indicated by the fact that only one transaction lacks a transaction amount.

f)Payment Mode:

- There were seven distinct payment methods noted.
- With 1,209 transactions, UPI is the most widely used mode.
- The prevalence of incomplete or abandoned payments is further supported by the fact that

the majority of the transactions (7,784 missing values) lack payment mode information.

g)Sources:

- There are four different places where traffic or purchases come from.
- With 7,040 transactions, Direct is the most popular source.

h)Coupons:

- Only about 7% of the 9,514 transactions used a coupon, with 8,852 of those transactions lacking a coupon code.
- With 234 appearances, Coupon 1 is the most frequently used coupon.

i)Use of Currency and Banks

- In 8,840 cases, the currency is primarily Indian rupees (INR) (₹), with the remaining cases using an unspecified currency.
- Just 92 transactions include a bank, and HDFC is the most frequently used bank, showing up 29 times.

Issues with Data Quality:

- Absent values:

About 93% of the coupon code is missing.

Mode of Payment: about 82% absent

Bank of Transaction: 99% absent

- A significant percentage of transactions remain unfinished, which may indicate:
- Bad checkout process
- Problems with payment gateways
- user hesitancy or mistrust.

Actionable Insights:

a)Improving Conversion Rates:

- Examine the reasons behind the non-completion of initiated payments.
- Enhance the checkout process or provide better assistance.

b)Strategies for Targeting

- Promote related products while concentrating on the top product (Product 8).
- To customize marketing campaigns for various client segments, use the Product Language data.

c)Promote Payment Finalization:

- For transactions that are not completed, send reminders or incentives.
- Encourage the use of widely accepted payment methods like UPI.

d)Use of Coupons:

- Given the low usage at the moment, consider providing more coupons or better discounts.

• e)Recommendations for Additional Analysis

- Link the sources and payment methods to the completion rates of transactions.
- To target high-value clients, divide users based on the amount of their transactions.
- To improve campaign planning, examine time-series trends (week over week or day over day).
